

WHAT I LEARNED

Through this project, I have learned how various Python concepts can be combined within a single program. The understanding of the OOP concept has improved through the creation of the Assignment class, and the usage of inheritance in Homework and Exam. I have also gained experience in the use of `super()`, storage of objects within a list and GradeTracker managing of the assignments. The implementation of the menu has provided a better understanding of how functions can be called within the program.

CHALLENGES I FACED

The debugging of the code that did not behave in an expected way has been a significant challenge. The problems include assignment addition to the tracker, menu connection to the functions, validation of scores, calculation of averages and filtering by month using `split()` and determining when no assignment is available. I have also learned how to use `lambda` to determine the assignment with the maximum and minimum scores. I have found that one of the mistakes made was passing `grade_tracker` as an argument of the `add_assignment()` function instead of using my functions `add_homework()` and `add_exam()`.

IF I HAD MORE TIME

I would use the additional time to improve the input validation of subjects, titles and dates. In addition, the code that is repeated when adding the homework and exams will be reduced, and the output will be more organized. Overall, this project has helped me to gain confidence in working with Python as I have built, tested, identified the errors and fixed them.
